

New Product Being
Private Labeled
By Remediation Express

- is non-toxic and environmentally friendly
- is on the U.S. Government's EPA SNAP-list of approved products
- is an industrial degreasing agent and cleaner, specially formulated to separate, encapsulate and rapidly biodegrade hydrocarbons in their environment.
- is water soluble and rapidly biodegradable.

- In the following demonstration, we created a complete concentration of raw crude oil mixed in with fertile top soil.
- After mixing the crude oil and top soil, a 10% solution of solution and water was added to polluted top soil and shaken for ten seconds.

- The following picture was taken immediately after agitation with approximately 90% of the crude oil immediately stripped from the top soil and the balance being stripped out in ongoing small streams.

- Separation and stratification of the elements begins to occur almost immediately.
- During the next few minutes, the remaining crude oil is separated from the carrier, with the oil being stripped out of the dirt in small oil “volcanoes” streaming to the top of the bottle in the combined solution/Crude Oil.

- You can see the crude oil being separated from the topsoil, rising to the top, being naturally separated from the water-based solution. All this took a total of 10 mins.
- There are three distinct layers
 - Reclaimed oil on top
 - solution in the middle
 - Cleansed soil on the bottom
